Designer: Jon Witt

This large waterfront deck held some interesting construction challenges. The first was transporting the material to the work zone. With no way to mechanically move the lumber to the lake side, every piece had to be hand-balmed from the rear

of the house, down to the embankment and to the water's edge. The design mandate was to create a platform that would allow uses of the area during the spring high water season. The highwater level is 8 inches below the deck surface, but only for a few weeks each year.

Once the deck area was complete, the builder then had to figure out the meandering path and stair system to traverse the steep hill, which has large outcrops of granite bedrock. Decking is fastened by the CAMO edge-fastening system for a clean barefoot approved finish.
