WHY PRO-FIT?

WHAT IS PRO-FIT®?

PRO-FIT® is a brand, a product and a partner that is the best fit for your business or project. You can expect...

Breadth of Line – Collated, Packaged and Bulk fastening solutions to fit tool and project requirements, and packaged to maximize space utilization - more facings per shelf.

Shopability – On-the-shelf and in-the-aisle Dress for Success merchandising and color-coding that improves way-finding, grows connect rates, and builds brand awareness.

Inventory Productivity – Smaller master counts for lower inventory investment and faster turns; mix relevance for your market; key SKU performance.

Service

- 98%+ fill rates.
- We evaluate and share market pricing movements with you to assist you in achieving your pricing strategy.
- Bi-annual line reviews to ensure the products, in the quantities you need, are always available for your customer base.

MDM Knowledge – Our Market Development Managers are the best the industry has to offer. You can count on them knowing you, your market and your customers to advise you on what you should consider carrying. And remember, they are National Nail Employee Owners.

SOLUTIONS CENTER

The PRO-FIT® Solutions Center offers the right fastener for virtually any residential project.

If you are looking for a vast selection of screws, PRO-FIT® has it. We have packaged screws for decking, drywall, multi-purpose, and specialty projects.

Need collated products? We've got them too. Our PRO-FIT® collated nails and staples cover a wide assortment of applications including framing, roofing, finishing, flooring, siding, and metal connectors.

Make PRO-FIT® your one-stop solution center for nails and screws.

NAILS

TERMINOLOGY

HEAD

Round metal piece formed at the top of the nail.

SHANK

The length of the nail between the bottom of head and the point. May be smooth or have rings, flutes or spirals for greater holding power.

POINT

Sharpened end opposite the head for greater ease in driving.

GAUGE

References how thick a nail is, with lower number indicating greater thickness.

LENGTH

Distance from the bottom of the head to the point of a nail.

RIGIDITY

The bending and shear resistance of a nail.

COATINGS

BRITE

No coating to protect the nail from corrosion if exposed to high humidity or water, not recommended for exterior use or treated lumber, and only for interior applications where no corrosion protection is needed, i.e. interior trim, framing, and finish.

HEAT-TREATED

Heated to extreme temperatures and then cooled quickly; this produces very hard steel that can be used with hardened materials such as concrete and masonry. This is still vulnerable to corrosion, and should be used in interior applications.

PHOSPHATE COATED

Reduces friction during installation and increases corrosion protection. Produced by dipping in a solution of zinc or manganese acid phosphate; it has a dark grey finish that provides a surface that binds well with paint and joint compounds with minimal corrosion resistance. Most commonly found on drywall fasteners, not recommended for exterior and treated lumber.

VINYL COATED

A slick vinyl coating helps ease driving of the fastener—when the fastener is driven, it's briefly heated by the friction and quickly cools down, hardening the vinyl coating; offers some extra holding power but does not protect the fastener from corrosion; recommended for interior applications where no corrosion protection is needed.

ELECTRO GALVANIZED

Zinc plating process in which a layer of zinc is bonded to steel to protect against corrosion; smooth, shiny finish, which is generally used in areas where minimal corrosion protection is needed.

GALVANIZED

Coated with a protective layer of zinc for corrosion resistance and weather exposure.

HOT DIPPED GALVANIZED

Most common method of galvanization where iron, steel or aluminum are coated with a thin zinc layer, by passing the metal through a molten bath of zinc that results in very high corrosion resistance suitable for some acidic and treated lumber; will corrode over time as the coating wears, but generally good for the lifetime of the application; typically used in outdoor applications—meets ASTM A153.

STAINLESS STEEL

Used where both the properties of steel and corrosion resistance are required; although stainless steel does not readily corrode, it isn't fully stain proof—certain conditions can and do affect it such as low oxygen, high salinity, or poor circulation environments; 300 series stainless makes up 70% of all stainless used, and is the most corrosion resistant, ductile, and weldable type of stainless steel; these alloys are subject to crevice corrosion and pitting corrosion.

304 / 305 grade alloys are the most versatile and widely used of stainless steels—contains 18% chromium and 8% nickel; recommended for exterior applications where a higher level of corrosion resistance is desired.

316 (also called marine grade) has superior corrosion resistance versus other chromium-nickel steels when exposed to chemical corrodents such as sea water; slightly more nickel and the addition of 2% molybdenum is what makes 316 considerably more resistant to corrosion than the 304 family; recommended for marine environments.

TERMINOLOGY

SHANKS

SMOOTH

Most common and often used for framing and general construction applications. They offer enough holding power for most everyday use.

RING

Small directional rings on the shank prevent the nail from working back out once driven in. They also provide superior holding power over smooth shank nails because the wood fills in the crevasse of the rings and provides friction to help prevent the nail from backing out over time.

DRIVE SCREW

Has helical shanks resembling a screw. Drive screw nails are mostly used with hardwood, provide greater holding power, and can sustain greater impact withdrawal work values than other nail forms do.

FLUTED

Vertical thread to minimize cracking when driving into cinder block, mortar joints or other soft masonry applications.

STEEL RIGIDITY

REGULAR STEEL STOCK

Low to medium carbon content - standard type of wire rod used in fastener manufacturing.

STIFF-STOCK

Higher carbon content steel - harder and stiffer than regular stock to prevent bending when driven into hardwoods.

TEMPERED HARDENED STEEL

High carbon content steel is used to make the nail and then the nail is heat treated which provides even better resistance to bending.

COMMON NAIL SIZES

What Does a Penny Mean?

The "d" when referring to nail sizes, stands for penny. When the Romans occupied what is now England, they had a coin called the denarius, which was also the name for an English penny, so the "d" is an abbreviation for denarius.

The "d" indicates the nail's length (see table on the right). The larger the number, the longer the nail. For example, a 3d is smaller than a 10d.

When nails were hand-forged, penny sizes referred to the price for 100 nails. The longer the nail, the higher the cost.

The system was used in England into the 15th century, but is now obsolete. However, the penny size is still included along with the length on retail boxes of nails today.

Penny	Size (inches)	Length (mm)
2d	1	25
3d	1-1/4	32
4d	1-1/2	38
5d	1-3/4	44
6d	2	51
7d	2-1/4	57
8d	2-1/2	65
9d	2-3/4	70
10d	3	76
12d	3-1/4	83
16d	3-1/2	89
20d	4	102
30d	4-1/2	115
40d	5	127

FRAMING

Framing nails are used for general construction where a thinner shank for driving ease is desired. PRO-FIT® framing nails come in three basic styles (Sinker, Common, and Box). They are used in building walls, roofs, applying sheathing, sub-flooring, and just about anywhere construction lumber is used.

SINKER

Checkered, flat countersunk head to prevent hammer slippage and provides a flush finish.

For construction, carpentry, and framing.

FINISH

Finish nails are used for trim and fine finishing work where a smaller, less visible head is desired. PRO-FIT® Finish nails come in three basic styles - Finish, Casing, and Hardened Trim. They are used to set door and window frames, apply trim, and in other applications where appearance is important.

FINISH

Finish nails are used for trim and fine finishing work. They can be easily concealed by countersinking the nail and filling the resulting void with a filler (putty, spackle, caulk, etc.)

ROOFING

Roofing nails are used for applying roofing asphalt shingles, insulation board, and felt to wood substrates. The large head and heavier shank gauge provide greater holding power. Roofing nails come in a variety of styles to fit multiple job requirements.

Bulk roofing nails are provided by our National Nail brand STINGER®

ROOFING

Roofing nails are used for applying asphalt shingles, insulation board, and felt to wood substrates.

LEAD HEAD

Head flattens out with impact making a leak-proof joint when driven through a metal roof.

Smooth, heavy shank provides greater resistance to bending.

Lead Head nails are for use with corrugated steel roofing and siding.

LEAD HEAD ROOFING NAILS

MASONRY

Masonry nails are hardened nails designed to be driven into concrete or the mortar used to hold together bricks or cement blocks. This rigidity also lends masonry nails to a wide variety of installations ranging from attaching plywood subfloor to securing carpet tack strips.

FLUTED MASONRY

Hardened – the steel is heated to extreme temperatures and quickly cooled, producing very hard steel that can be used with hard materials such as concrete and masonry.

MASONRY

CUT MASONRY

Hardened – the steel is heated to extreme temperatures and quickly cooled, producing very hard steel that can be used with hard materials such as concrete and masonry.

Cut masonry nails are used for attaching wood to cinder block, mortar joints, brick walls and fresh concrete.

CUT MASONRY

STAPLES

Staples are a type of a two-pronged fastener used for joining or binding materials together. The PRO-FIT® Staple category includes fence, fish hook, poultry net, and stockade staples that may be used for installing fencing, electrical, wire poultry netting, stockade panels, or other heavy-duty uses.

FENCE

Steel wire.

For attaching woven wire fence, welded fence, or barbed wire to wooden fence posts.

FENCE STAPLES

SIDING

Siding nails are used for applying residential wood lap siding to plywood or fiberboard sheathing. The PRO-FIT® Siding category includes Aluminum and Cedar Shake fasteners that may be used for installation.

CEDAR SHAKE

Small, checkered brad head for concealment and reduced hammer slippage.

Cedar shake nails are used for cedar shake siding applications.

CAPS

Caps are nails with a round plastic or steel disc used to secure the building envelope. The cap provides greater holding power than nails and staples alone. Cap nails are used in residential and commercial settings.

Bulk caps nails are provided by our National Nail brand STINGER®

RING SHANK PLASTIC CAP

1" diameter round, plastic cap.

Deformed ring shank for greater holding power.
All hand-driven caps are packaged as integral nail-cap units.

Plastic caps are used for securing roofing underlayment, house wrap, and insulation in residential and commercial applications.

CAPS

STEEL CAP

1" diameter round, steel cap.

Heavier, deformed ring shank for greater holding power.

Steel caps are used for applying asphalt shingles, insulation board, roofing underlayments, built-up (BUR) modified, and single-ply on nailable wood roof decks.

STINGER® Steel HandDrive

SCREWS

TERMINOLOGY

**HEAD**

Round metal piece at the top of the screw.

THREAD

The spiral ridge on a screw; designed so the screw can be rotated into or out of an object.

POINT

Sharpened end opposite the head for greater ease in driving.

DRIVE

Part of a screw or bolt head that meshes with a tool and allows the tool to rotate it; designed into the head, various designs work with different tools; drive surface can be internal (recessed) or external.

LENGTH

Distance from the bottom of the head to the point of a screw.

COATINGS

CERAMIC COATED

Made of sprayed aluminum oxide or zirconium oxide, essentially crystalline nature, applied as a protective film on metal to protect against temperatures above 110°C; highly resistant to corrosive compounds and friction. Coating may be thick or thin depending on the functional application, and is often used for exterior building and pressure treated lumber.

PHOSPHATE COATED

Used to reduce friction during installation and increase corrosion protection. It is a conversion coating on steel produced by dipping in an aqueous solution of zinc or manganese acid phosphate. It has a dark grey to black finish providing a surface that binds well with paint and joint compound with minimal corrosion resistance. Most commonly found on drywall fasteners, phosphate coating provides minimal corrosion resistance and is recommended for interior use only.

SILVER ZINC COATED

Silver chromate plating applied as a sealer over zinc that is less than 1 mm thick. Zinc plating is the most common and economical type of plating and is a sacrificial coating designed to corrode so the screw doesn't. The limitations of zinc are that when the plating begins to corrode the zinc rust is plentiful.

YELLOW ZINC COATED

Yellow, dichromate plating applied as a sealer over zinc that is less than 1 mm thick. This coating is used on fasteners designed for interior applications when appearance is a concern. It offers a modest amount of corrosion resistance (approx. 100 hours of salt spray to 10% red rust).

HOT DIPPED GALVANIZED

Most common method of galvanization where iron, steel, or aluminum are coated with a thin zinc layer, this results in high corrosion resistance suitable for some acidic and treated lumber. It will corrode over time as the coating wears, but is generally good for the lifetime of the application - typically used in outdoor applications.

TERMINOLOGY

HEADS

BUGLE HEAD

Tapered, countersinking that has a smooth progression from the shank to the angle of the head, compresses the surface of the material under it as driven.

TRIM HEAD

Countersinks like a finish nail, and is used for the fine carpentry applications.

WAFER HEAD

Flat, wide head ideal for installing cement board.

PAN HEAD

A low disc with chamfered outer edge. It has a flat bearing surface and is designed for light gauge steel to steel applications.

HEX WASHER HEAD

For fastening steel to steel, it can be driven with a nut driver.

DRIVES

COMBINATION

Combines Phillips/Square screw drives. While a standard Phillips or Square (Robertson) tool can be used, there's also a dedicated tool that increases the surface area between the tool and the fastener so it can handle more torque. It's also known as the Quadrex screw drive.

PHILLIPS

A cross-shaped recess designed so the driver will ride out, or cam out under strain to prevent over-tightening and prevent the fastener from damaging the work or the head.

SQUARE

A square-shaped recess in the screw head. The screwdriver has a square protrusion on the tool, and both the tool and the socket have a taper. This helps to make inserting the tool easier, and tends to help keep the screw on the tool tip without the user needing to hold it there. Also known as a Robertson drive.

STAR

A star-shaped recess with six points of contact. It's designed to permit increased torque transfer from the driver to the bit compared to other drive systems. It resists cam out for extended bit life, and is often referred to by the original proprietary brand name, Torx®.

THREADS

COARSE

Provides superior holding power when attaching to wood.

FINE

Provides superior holding power when attaching to light-gauge steel.

HI-LO

For attaching drywall to light-gauge steel or wood studs. This type also provides higher resistance to strip-out.

POINTS

SHARP POINT

A very sharp point that aids in quick driving; standard screw point for fastening into wood and other medium to soft materials; also known as a Type A point.

SELF DRILLING

Has a drill-shaped point to penetrate medium to heavy 12-20 gauge steel (too thick to be pierced); eliminates the need for drilling a pilot hole; designed for use in soft steel or other metals; points are numbered from 1 through 5 - the larger the number, the thicker the metal it can go through without a pilot.

SELF PIERCING

Has a cylindrical shaft, sharp thread, and needle point that cuts its own hole, and is often used in light gauge sheet metal or plastic applications. The point stabs through the material, making a hole slightly smaller than the minor diameter of the threads. The lower part of the shank is designed to cut threads as the screw is driven into an untapped hole, and extrudes the metal for increased thread engagement and reduced stripping. The advantage of this screw type is that if the screw is reinstalled, new threads aren't cut as the screw driver is.

DECKING

Decking screws are used for decking and wood-to-wood construction. The PRO-FIT® Decking screws category includes ceramic coated deck screws with coarse threads for superior holding power when attaching to wood.

CERAMIC COATED

Ceramic Coated to protect against high temperatures; highly resistant to corrosive compounds and more resistant to friction.

Used for wood-to-wood construction.

SPECIALTY

Specialty screws are a collection of fastener solutions that fulfill unique requirements for specific applications. The PRO-FIT® Specialty screw category includes Post-Frame, Cement Board, Laminate, and Pan Head Screws.

POST FRAME

For fastening metal roof and wall panels to the wood framing for post frame building.

TERMINOLOGY

SAFETY REMINDER - Nail guns can be dangerous, so safety precautions similar to those for a firearm are usually recommended. In September 2011 The Occupational Safety and Health Administration (OSHA) and the National Institute for Occupational Safety and Health (NIOSH) issued a nail gun safety guide that details practical steps to prevent injuries including use of tools with sequential triggers, training prior to use, and use of appropriate protective equipment. We encourage you to be aware of these precautions.

FINDING THE PROPER DEGREE

To determine the proper fastener length and degree, place your strip of nails on the chart below. Position the shank of the first nail over the grey line, with the nail point over the black dot in the lower left corner.

GAUGE CHART

Number of Gauge	8	9	10	10 ^{1/4}	11	11 ^{1/2}	12	12 ^{1/2}	13	13 ^{1/2}	14	15	16	17	18	19	20	21	22	23
Inch	0.162	0.148	0.135	0.131	0.120	0.113	0.105	0.099	0.091	0.086	0.080	0.072	0.062	0.054	0.047	0.041	0.035	0.032	0.028	0.025
MM	4.114	3.766	3.342	3.330	3.061	2.870	2.150	2.324	2.324	2.180	2.032	1.828	1.587	1.371	1.206	1.041	0.889	0.812	0.711	0.635

TERMINOLOGY

ANGLE

The degree of collation.

HEAD

Round metal piece formed at the top of the nail.

SHANK

The length of the nail between the head and the point.

POINT

Sharpened end opposite the head for greater driving ease.

GAUGE

References how thick a fastener is, with lower numbers indicating greater thickness.

CROWN

The width across the top of a staple.

LEG

The length of a staple from the top of the crown to the point.

COATINGS

BRITE

No coating to protect the nail from corrosion if exposed to high humidity or water; not recommended for exterior use or treated lumber, and only for interior applications where no corrosion protection is needed, i.e. interior trim, framing, and finish.

ELECTRO GALVANIZED

Zinc plating process in which a layer of zinc is bonded to steel to protect against corrosion; smooth, shiny finish which is generally used in areas where minimal corrosion is needed.

EXTERIOR GALVANIZED

A high-grade anti-corrosion treatment technology that consists of three layers: 1) metallic zinc, 2) a high grade anti-corrosion chemical conversion film, 3) a baked ceramic top coating; used in outdoor applications - meets ASTM B117.

HOT DIPPED GALVANIZED

Most common method of galvanization where iron, steel, or aluminum are coated with a thin zinc layer, this results in high corrosion resistance suitable for some acidic and treated lumber. It will corrode over time as the coating wears, but is generally good for the lifetime of the application - typically used in outdoor applications - meets ASTM A153.

STAINLESS STEEL

Combines the properties of steel and corrosion resistance. Conditions such as low oxygen, high salinity, or poor circulation can corrode the material. 300 series stainless comprises 70% of all stainless used, and is the most corrosion resistant, ductile, and weldable, but are subject to crevice and pitting corrosion.

304/305 grades are the most versatile and widely used-contains 18% chromium and 8% nickel; recommended for exterior applications where a high level of corrosion resistance is desired.

316 grade, marine grade, has superior corrosion resistance when exposed to chemical corrodents such as sea water; slightly more nickel and the addition of 2% molybdenum is what makes the resistance to corrosion greater. Recommended for marine environments.

ALL PRO-FIT® COLLATED FRAMING NAILS, BRITE OR COATED, ARE VINYL DIPPED ON THE BOTTOM HALF OF THE FASTENER TO ENHANCE DRIVEABILITY AND HOLDING POWER

TERMINOLOGY

PLASTIC STRIP

Generally used for 20° - 22° framing nails. They are held together by a strip of plastic that breaks apart when fired by a gun. They're often less expensive since they are easy to manufacture. They can become very brittle when cold, and the residual plastic must be disposed of. Pieces of plastic are sometimes left under the head, causing the nail to be exposed.

WIRE STRIP & COIL

Generally used for 28° strip nails and 15° coil nails. Wire Strip fasteners use thin pieces of wire that run lengthwise to hold the fasteners in position. They're not as susceptible to water or cold weather as paper or plastic collated nails. However, the wire may fly off, and they are prone to having pieces of wire stuck under the head, exposing the nail.

PLASTIC COIL

Generally used for 15° - 90° coil nails. Fasteners are inserted into a plastic band. The band exits the coil nailer in one piece, eliminating pieces of the plastic stuck under the nail head when the nail is driven - making for easy cleanup. Plastic collation is a higher price alternative to plastic strip and is most commonly used for siding and applications where less reloading is desired.

PAPER STRIP

Generally used for 30° - 34° framing nails. Fasteners are held together by a strip of paper with glue. The paper around the fastener is driven into the wood alongside the fastener. Paper tape reduces the risk of having material stuck under the nail head and leaving the top of the fastener exposed. They may easily break apart, and don't work well in wet or moist conditions since the nails can become loose.

GLUE

Generally used for staples, brads, and floor cleats. The glue's only purpose is to hold the fasteners together while they are being driven. They offer no extra holding power after the fastener has been driven.

TAPE

Generally used for finish nails. It's clear tape collation, a stretched polyester film, that's very clean, stronger than glue, and adds durability to longer strips.

TERMINOLOGY

HEADS

BRAD HEAD

Smaller head allows nail to be concealed more easily; reduced holding power; used for finish and trim work.

CLIPPED HEAD

Standard round-head nail on the front side, but the back of the head is clipped off flush with the shank of the nail. Nails can be placed close together, which allows for less frequent loading. A specially coated paper strip applied to both sides of the clip keeps the nails in place. Some jurisdictions, especially in areas subject to sudden bursts of high wind, such as hurricanes, don't allow the use of clipped head framing nails.

ROUND

Heads are completely round, like standard hand-drive framing nails, and provide greater resistance to pull out. The nail strips are paper tape or plastic collated. Since the heads are fully round, a space must be maintained between the shanks, meaning that the collation wraps each nail rather than just being applied to the sides.

OFFSET ROUND HEAD

Instead of the head being centered on the shank, the head is offset to one side, which allows the shanks to touch one another when collated. These heads are designed to be fired in a clipped-head nailer, effectively turning a clipped head into a round-head nailer.

SHANKS

SMOOTH

Most common and often used for framing and general construction applications. They offer enough holding power for most everyday use.

DRIVE SCREW

Has helical shanks resembling a screw. Drive screw nails are mostly used with hardwood, provide greater holding power, and can sustain greater impact withdrawal work values than other nail forms do.

RING

Small directional rings on the shank prevent the nail from working back out once driven in. They also provide superior holding power over smooth shank nails because the wood fills in the crevasse of the rings and provides friction to help prevent the nail from backing out over time. Often used in softer types of wood where splitting isn't an issue.

POINTS

DIAMOND POINT

A 4-sided pyramid; most common point.

BLUNT DIAMOND POINT

Rounded diamond point to drive easier than a blunt nail without splitting.

BLUNT POINT

Reduces the chance of splitting wood, but is more difficult to drive.

COLLATED NAILS

15°

WIRE COIL

For general construction, framing, sub-flooring, roof sheathing, deck and fence building, pallets, boxes, and crating.

MERCHANDISING

Dress for Success

From banner signs and door clings that draw customers into your store, to bold header boards, informative aisle violators, color-coded shelf talkers, and counter mats for your contractor desk, these visual aids build brand awareness and make product selection easy.

Header Boards

Aisle Violators

Yard Banner

Counter Mat

Reduced Inventory Investment

Small master counts lower the inventory required on the shelf and increases turns (12 - 1lb boxes per master - and, 4 - 5lb boxes per master).

Smart Packaging

A clean, color-coded trilingual labeling, display masters, and informative P.O.P. make the fastener aisle pop, and product easy to locate.

Our merchandisers are designed to attract, engage and motivate customers to purchase our products. Using color-coding and detailed graphics with call-outs, our header boards and side panels help reinforce the brand and educate customers to make informed buying decisions. They are also great for seasonal project placement.

NATIONAL NAIL

Your brand experience should be special. At National Nail, our brands should make you a **rock star** when it comes to providing product solutions your customers need. The products position you as an innovation leader with new technologies that make builders better at what they do.
